

#### Operations Research System Tora Software Free Download

Do you want to learn more about operations research? Tora is a software system that implements operations research methods. Tora was originally developed for the U.S. Army Research Institute for the Behavioral and Social Sciences, but it has since been widely used by colleges and universities worldwide to provide students with an opportunity to learn about operations research in a hands-on setting. Tora is a general-purpose operations research tool that can be used for a wide range of problems, from logistics and planning to design of experiments and simulation. Operations research has been called the science of choice because it allows managers to make decisions that improve the performance of their organizations. Tora is designed for anyone with an interest in operations research, from undergraduate students to experienced professionals. Whether your interests lie in computer science, economics, engineering, or management science—or if you are simply interested in applying your knowledge in new areas—Tora provides an environment that will allow you to explore these subjects further, learn more about how they work together, and discover their practical applications. Tora is not just another software package that you can try for a week or two. It is designed to help you learn more about operations research and how it applies to your business problems. It lets you explore real-world questions in operations research, rather than focusing solely on specific textbook problems the way many other books and courses do. The screen shots in this book are taken directly from Tora's Windows GUI. Most operations research texts lack the visual aids needed to convey the concepts, but this book illustrates these concepts with Tora's graphics so you can see them for yourself. The Tora software system has been in continuous use for over 15 years and has been in use in more than 700 universities and research centers. It has been used by students and researchers around the world, including:

Tora also makes it possible for individuals to run customized research projects for their organizations. For example, a Fortune 500 company can use Tora to study its own operations and design experiments that will help it improve its operations. The user community is regularly updated with new features, bug fixes, minor updates incorporating new features, and templates that simplify the configuration of problems to solve.

Tora is a software product of Operations Research System (ORS), which was founded by Dr. Michael J. Gorman, Dr. Sumit Das, and Dr. Lester Faier III in 1987.
